## Exam 5EE40 Electrical Power Engineering \& System Integration Wednesday 27 January 2010, 9.00-12.00.

## 6 problems, 5 pages.

## Problem 1 (1 point)

A 3-phase 50 Hz network with a phase voltage of 230 V is feeding a symmetrical load $\mathrm{Z}_{\text {load }}=(100-\mathrm{j} 100) \Omega$ connected in Y -connection. Calculate the total apparent power and the total active and reactive power.

## Problem 2 (1 point)

A 3-phase electromotor with an apparent power $\mathrm{S}=30 \mathrm{kVA}$, is connected in "delta" to a 50 Hz three phase grid with a line voltage of 400 V . The powerfactor is $\cos \varphi=0,8$ (inductive).
a) Calculate the line-currents in the supplygrid, and the currents in the windings of the motor.
b) What is the value of the compensating capacitors (in $\mu \mathrm{F}$ per phase, connected in "star") to reduce the powerfactor to $\cos \varphi^{\text {c }}=0,95$ ?

## Problem 3 (2 points)

A 3-phase, $2300 \mathrm{~V}, 60 \mathrm{~Hz}$, 6-pole, Y-connected synchronous motor has 4.5 ohms per phase synchronous reactance and negligible stator winding resistance. The motor is connected to an infinite bus and draws 250 A at 0.8 power factor lagging.
a) Determine the output power, consider no (mechanical or electrical losses).
b) Determine the power to which the motor can be loaded slowly without losing synchronism. Determine the torque, stator current, and supply power factor for this condition.
c) Draw the equivalent electrical scheme and phasor diagram.

## Problem 4 (2 points)

Consider a sinusoidal-PWM single-phase full-bridge inverter connected to the grid through an inductor $L_{s}=20 \mathrm{mH}$ (see figure below), where $v_{s}(t)=\sqrt{2} V_{s} \sin \omega_{s} t$
with $V_{s}=220 \mathrm{Vrms}$ and $\omega_{s}=2 \pi * 50 \mathrm{rad} / \mathrm{s}$.

The inverter dc voltage, $v_{d}$, can vary between 350 Vdc and 700 Vdc . The 50 Hz component of $v_{\text {conv }}(t)$, the voltage at the inverter ac terminals, is controlled by the modulation index $m_{a}$ (with $\left|m_{a}\right|<1.0$ ) such that the rms of $v_{\text {conv }}(t)$ is found to be $V_{\text {conv }}=m_{a} V_{d} / \sqrt{2}$.
a) What is the highest rms value of the inverter output ac voltage, $V_{\text {conv,max }}$, that can always be assured in spite of the dc voltage variations?
b) The volt-ampere rating of the inverter is specified as 5000 VA , that is, $V_{\text {conv, max }} I_{s, \text { max }}=5000 \mathrm{VA}$, where $I_{s}$ denotes the rms value of $i_{s}(t)$, the inverter output current. Calculate the peak value of the current through the switches and the peak value of the voltage across the switches when $v_{d}=700 \mathrm{Vdc}$.
c) Draw a phasor diagram representing $v_{\text {conv }}$ and $v_{s}$, and calculate the corresponding phase angle $\delta$ between the voltage phasors when $v_{d}=700 \mathrm{Vdc}, m_{a}=0.5$ and with the inverter delivering 2000 W to the grid.

## Problem 5 (2 points)

The figure below shows a medium voltage network. The nodes are connected via cables. The loads P11-P13, and P21-P22 are similar ( $2 \mathrm{MW} / 0.66 \mathrm{MVAr}$ ). Due to a new building project, the load P23 is twice the load at the other nodes ( $4 \mathrm{MW} / 2.4 \mathrm{MVAr}$ ). A connecting cable K between the nodes MV13 and MV23 is open (not connected at node MV23). Also the generator at node MV23 is not connected.
a) A loadflow calculation for this network is given below. Explain the various voltage levels at the nodes, and the current levels of the cables. Explain the current in the cable between MV13-MV23.

b) To improve the voltage level at nodes MV22 and MV23, three situations are evaluated: i) closing of the connecting cable K between MV13 and MV23, (ii) an asynchronous generator to node MV23 (connecting cable K open), and iii) a synchronous generator to MV23 (connecting cable K open). Both the asynchronous and the synchronous generator have a similar nominal power rating of 4 MW . The loadflow calculations for these three situations are given below. Answer the following questions:

- For each situation, explain the various voltage levels at the nodes, and the current levels in the cables.
- Apparently, the asynchronous and the synchronous generator behave differently. What is the major difference between the two generator-types?
- What is the best solution, and motivate your answer?

## Problem 6 (2 points)

A manufacturer of street lights wants to develop a new autonomous street light for the Netherlands operating on solar energy. The light must be on from sunset to sunrise every day. To minimize maintenance costs, the $12 \mathrm{~V}_{\mathrm{DC}}$ battery may only be replaced once every 5 years since this is also the expected lifetime of the light. The light has a power of 26 W and operates on a voltage of 230 VAC . The required inverter has an efficiency of $95 \%$. Each separate section of DC cable in the system has an efficiency of $99 \%$. The battery has an efficiency of $90 \%$. The solar panels are mounted on top of the street lights with an angle of 30 degrees south. Please make use of Tables 1 and 2 and Figures 1 and 2 to answer the following questions.
a) Draw a block scheme of the installation. [20\%]
b) Calculate the size of the battery (Ah). [40\%]
c) Calculate the required power $(\mathrm{Wp})$ of the solar panel. To determine the maximum power of a panel, the panels have been tested under standard test conditions (STC=1kW/M2). [30\%]
d) What can be done to improve the system? [10\%]

## Solutions:

## Problem 1

Apparent power in one phase:
$\underline{S}_{1 p}=\frac{V_{\text {phase }}^{2}}{\underline{Z}^{*}}=\frac{(230 \mathrm{~V})^{2}}{(100+j 100) \Omega}=(264,5-j 264,5) \mathrm{VA}$
$\underline{S}_{\text {tot }}=3 \underline{S}_{1 p}=(793,5-j 793,5) V A$ capacitive
$\underline{I}=\frac{V}{\underline{Z}}=\frac{230 V}{(100-j 100) \Omega}=(1,15+j 1.15) A$

## Problem 2

a)
$S=\sqrt{ } 3 U_{n} I \Rightarrow I=S /\left(\sqrt{ } 3 U_{n}\right)=\{30 /(\sqrt{ } 3400)\} \mathrm{kA}=\underline{43,30 \mathrm{~A}}$
$\mathrm{I}_{\mathrm{W}}=\mathrm{I} / \sqrt{ } 3=\{43,30 / \sqrt{ } 3\} \mathrm{A}=\underline{\underline{24,99 \mathrm{~A}}}$
b)
$\mathrm{P}=\mathrm{S} \cos \varphi=(300,8) \mathrm{kW}=24 \mathrm{~kW}$
$\mathrm{Q}=\mathrm{S} \sin (\operatorname{arc} \cos \varphi)=(300,6) \mathrm{kVAr}=18 \mathrm{kVAr}$
$\mathrm{Q}^{\prime}=\mathrm{P} \tan \varphi^{\star}=\mathrm{P} \tan \left(\operatorname{arc} \cos \varphi^{\star}\right)=240,328 \mathrm{kVAr}=7,888 \mathrm{kVAr}$
$\mathrm{Q}_{\mathrm{C}}=\mathrm{Q}-\mathrm{Q}^{\prime}=(18-7,888) \mathrm{kVAr}=10,11 \mathrm{kVAr}$
$\mathrm{Q}_{\text {Cfase }}=\mathrm{Q}_{\mathrm{C}} / 3=(10,11 / 3) \mathrm{kVAr}=3,37 \mathrm{kVAr}=(\mathrm{U} / \sqrt{ } 3)^{2} / \mathrm{X}_{\text {Cfase }}$
$\mathrm{X}_{\text {Cfase }}=\mathrm{U}^{2} /\left(3 \mathrm{Q}_{\text {Cfase }}\right)=\left(400^{2} /(33,37) \mathrm{m} \Omega=15,82 \Omega=1 /\left(\omega \mathrm{C}_{\text {fase }}\right)\right.$
$C_{\text {fase }}=\{1 /(2 \pi 5015,82)\} \mathrm{F}=\underline{\underline{201}, 1} \mu \mathrm{~F}$

## Problem 3

....elena

## Problem 4

(a)

$$
V_{c o n v, \max }=m_{a, \text { max }} V_{d, \text { min }} / \sqrt{2}=1.350 / \sqrt{2}
$$

$=247 \mathrm{Vrms}$
(b)

$$
I_{s, \text { max }}=\frac{5000 \mathrm{VA}}{V_{\text {conv, }, \max }}=\frac{5000}{247}=20.2 \mathrm{Arms}
$$

$$
I_{s, \text { peak }}=\sqrt{2} I_{s, \text { max }}=28.6 \mathrm{~A}
$$

Switch peak current $=I_{s, \text { peak }}=28.6 \mathrm{~A}$
Switch peak voltage $=v_{d}=700 \mathrm{~V}$
(c)
$V_{\text {conv }}=m_{a} V_{d} / \sqrt{2}=0.5 .700 / \sqrt{2}$
$P=\frac{V_{s} V_{\text {conv }}}{2 \pi f L_{s}} \sin \delta$
$\sin \delta=\frac{2 * \pi * 50 * 20 e-3 * 2 e+3}{220 * 0.5 * 700 / \sqrt{2}}=0.231$
$\delta=0.233 \mathrm{rad}=13.3 \mathrm{deg}$
